### **Warranty**

Penn Yan Aero warrants all equipment manufactured by it and bearing its nameplate and all repairs made by Penn Yan Aero to be free from defects in material or workmanship under normal use and service for a period of one year from the date of delivery to the Purchaser. Penn Yan Aero will repair or replace, at its option, without charge, F.O.B. Penn Yan Aero any equipment or part thereof found to be defective in material or workmanship if such item is returned to Penn Yan Aero transportation prepaid.

### **Limitation of Warranty and Liability**

The liability of Penn Yan Aero (except as to title) shall in no case exceed the cost of correcting defects in products and shall not extend beyond one year from date of delivery. All claims for defective products or parts under this warranty must be made in writing immediately upon discovery. Penn Yan Aero assumes no liability for the consequences of misuse of products by the Purchaser.

The foregoing is expressly in lieu of all other warranties whatsoever, express, implied, or statutory, including without limitation the implied warranties of merchantability and fitness for purpose. Any references by Penn Yan Aero to Purchaser's specifications and similar requirements is only to describe products, and no representation or other terms therein shall have any force or effect. Catalogs, circulars, and similar literature of Penn Yan Aero are issued for general information purposes only and shall not be deemed to modify the provision hereof.

The foregoing is Penn Yan Aero's only obligation and the Purchaser's only remedy for breach of warranty; and except for gross negligence, willful misconduct, and remedies permitted under any other clause of these Terms and Conditions, the foregoing is the Purchaser's only remedy hereunder by way of breach of contract, negligence or otherwise. In no event shall the Purchaser be entitled to incidental, special, or consequential damages. Penn Yan Aero does not authorize any agent or representative to warrant product fitness for any particular use or to make any other warranty, express or implied, or to assume any other liability, except as set forth herein.

POH and AFM Supplement  
for Cessna 172N

## SECTION I - General

### DESCRIPTIVE DATA

#### A. Engine

Number of engines: 1  
Engine Manufacturer: Textron Lycoming  
Engine Model: O-320-D2J, -D2G, -D1A  
Horsepower Rating and Speed: 160 rated BHP at 2700 RPM

## SECTION II - Limitations

- A. The following placard must be displayed adjacent to the flap position selector switch:

MAXIMUM FLAP TRAVEL IS 30°

#### B. C.G. Range

##### Landplane:

Normal category	(+39.5) to (+47.3) at 2400 lb.
	(+35.0) to (+47.3) at 1950 lb. or less
Utility category	(+36.5) to (+40.5) at 2100 lb.
	(+35.0) to (+40.5) at 1950 lb. or less

##### Floatplane: (Edo 89-2000 or 89A2000 floats)

Normal category	(+39.8) to (+45.5) at 2220 lb.
	(+36.4) to (+45.5) at 1825 lb. or less

Straight line variation between points given.

## SECTION III - Emergency Procedures - No Change.

## SECTION IV - Normal Procedures - No Change.

## SECTION V - Performance - See Pages 3 thru 10.

## SECTION VI - Weight and Balance - See Page 11.

FAA APPROVED  
DATE: MAR 01 1989

CESSNA MODEL 172N Aircraft Modified  
Per Penn Yan STC  
2400 lb. gross wt.

required to complete the trip with ample reserve.

#### LANDING

A procedure similar to takeoff should be used for estimating the landing distance at the destination airport. Figure 5-11 presents landing distance information for the short field technique. The distances corresponding to 2000 feet and 30°C are as follows:

Ground roll	610 Feet
Total distance to clear a 50-foot obstacle	1390 Feet

A correction for the effect of wind may be made based on Note 2 of the landing chart using the same procedure as outlined for takeoff.

#### DEMONSTRATED OPERATING TEMPERATURE

Satisfactory engine cooling has been demonstrated for this airplane with an outside air temperature 23°C above standard. This is not to be considered as an operating limitation. Reference should be made to Section 2 for engine operating limitations.

#### AIRSPEED CALIBRATION NORMAL STATIC SOURCE

##### CONDITION:

2400 lb. gross wt.

### CRUISE

The cruising altitude should be selected based on a consideration of trip length, winds aloft, and the airplane's performance. A typical cruising altitude and the expected wind enroute have been given for this sample problem. However, the power setting selection for cruise must be determined based on several considerations. These include the cruise performance characteristics presented in figure 5-8, the range profile charts presented in figure 5-9, and the endurance profile charts presented in figure 5-10.

The relationship between power and range is illustrated by the range profile charts. Considerable fuel savings and longer range result when lower power settings are used. For this sample problem, a cruise power of approximately 65% will be used.

The cruise performance chart, figure 5-8, is entered at 6000 feet altitude and 20°C above standard temperature. These values most nearly correspond to the planned altitude and expected temperature conditions. The engine speed chosen is 2500 RPM, which results in the following:

Power	66%
True airspeed	112 Knots
Cruise fuel flow	7.4 GPH

The power computer may be used to determine power and fuel consumption more accurately during the flight.

### FUEL REQUIRED

The total fuel requirement for the flight may be estimated using the performance information in figures 5-7 and 5-8. For this sample problem, figure 5-7 shows that a climb from 2000 feet to 6000 feet requires 1.6 gallons of fuel. The corresponding distance during the climb is 10 nautical miles. These values are for a standard temperature and are sufficiently accurate for most flight planning purposes. However, a further correction for the effect of temperature may be made as noted on the climb chart. The approximate effect of a non-standard temperature is to increase the time, fuel, and distance by 10% for each 10°C above standard temperature, due to the lower rate of climb. In this case, assuming a temperature 16°C above standard, the correction would be:

$$\frac{16^\circ\text{C}}{10^\circ\text{C}} \times 10\% = 16\% \text{ Increase}$$

### SECTION 5 PERFORMANCE

SECTION 5  
PERFORMANCE      Aircraft Modified  
Per Penn Yan STC  
2400 lb. gross wt.

CESSNA  
MODEL 172N

With this factor included, the fuel estimate would be calculated as follows:

Fuel to climb, standard temperature	1.6
Increase due to non-standard temperature (1.6 × 16%)	0.3
Corrected fuel to climb	1.9 Gallons

Using a similar procedure for the distance to climb results in 12 nautical miles.

The resultant cruise distance is:

Total distance	320
Climb distance	-12
Cruise distance	308 Nautical Miles

With an expected 10 knot headwind, the ground speed for cruise is predicted to be:

$$\frac{112}{-10} = 102 \text{ Knots}$$

Therefore, the time required for the cruise portion of the trip is:

$$\frac{308 \text{ Nautical Miles}}{102 \text{ Knots}} = 3.0 \text{ Hours}$$

The fuel required for cruise is:

$$3.0 \text{ hours} \times 7.4 \text{ gallons/hour} = 22.2 \text{ Gallons}$$

A 45-minute reserve requires:

$$\frac{45}{60} \times 7.4 \text{ gallons/hour} = 5.6 \text{ Gallons}$$

The total estimated fuel required is as follows:

Engine start, taxi, and takeoff	1.1
Climb	1.9
Cruise	22.2
Reserve	5.6
Total fuel required	30.8 Gallons

Once the flight is underway, ground speed checks will provide a more accurate basis for estimating the time enroute and the corresponding fuel

PERFORMANCE

## TIME, FUEL, AND DISTANCE TO CLIMB

## MAXIMUM RATE OF CLIMB

## CONDITIONS:

Flaps Up  
Full Throttle  
Standard Temperature

## NOTES:

1. Add 1.1 gallons of fuel for engine start, taxi and takeoff allowance.
2. Mixture leaned above 3000 feet for maximum RPM.
3. Increase time, fuel and distance by 10% for each  $10^{\circ}\text{C}$  above standard temperature.
4. Distances shown are based on zero wind.

## LANDING DISTANCE

### SHORT FIELD

CONDITIONS:  
Flaps 30°  
Power Off  
Maximum Braking  
Paved, Level, Dry Runway  
Zero Wind

NOTES:

1. Short field technique as specified in Section 4.
2. Decrease distances 10% for each 9 knots headwind. For operation with tailwinds up to 10 knots, increase distances by 10% for each 2 knots.
3. For operation on a dry, grass runway, increase distances by 45% of the "ground roll" figure.
4. If a landing with flaps up is necessary, increase the approach speed by 7 KIAS and allow for 35% longer distances.
